

FIRE SIMULATION VEHICLE TRAINING

This cutting-edge training tool is based on a proven learning model of goal-setting, practice, feedback and application. Through experimental training, drivers know what to do in real driving situations because they've "been there."

Your drivers will get practice (and feedback) on safety-related skills, including:

- Hazard perception
- Speed and space management
- Skid control and recovery
- Emergency maneuvers
- Cornering
- Braking
- Use of mirrors
- Backing

Your drivers can practice all this, and more...in a wide range of driving scenarios!

CUSTOMIZATION PUTS YOU IN CONTROL!

With MPRI-L3 you can align the simulator experience with your training goals and individual drivers' needs.

It all adds up to a targeted, highly individualized training experience your drivers can readily apply to their everyday driving.

CHOOSE YOUR HAZARDS!

Put your drivers to the test on icy mountain roads, foggy country highways, rain-soaked city streets and more. Choose from default "hazard settings" or put together your own combinations.

CHOOSE YOUR TRIPS!

Based on hundreds of miles of actual U.S. roads and highways, TranSim VSIII lets you select trips similar to the ones your drivers travel...and assign them to specific drivers, based on your training needs.

GAIN VALUABLE INSIGHTS ON YOUR DRIVERS' SAFETY HABITS

After a driver completes a "trip" on the simulator, you can view a customized Trip Report that gives you important information about your drivers' habits and skills that need improvement.

Plus, a special replay feature lets you watch a completed trip (or selected segments) from 11 different camera angles. Along with your driver, you can review exactly where mistakes occurred – and discuss how to handle things differently on a real road.

It's an eye-opening way to help curb bad habits before they lead to costly incidents and expensive maintenance problems.
